

24. PWM Delay Generation Circuit (PDG)

24.1 Overview

The PWM Delay Generation circuit (PDG) has 4 channels delay circuits that can connect to the GPT. The PDG can control the rise and fall edge timing with which the PWM output for the GPT320 through the GPT323.

[Table 24.1](#) lists the specifications for the PWM Delay Generation Circuit, [Figure 24.1](#) shows a block diagram, and [Table 24.2](#) lists the I/O pins.

Table 24.1 Specifications of the PWM Delay Generation Circuit

Parameter	Specifications
Function	The circuit can control the timing with which signals on the two PWM output pins for channel 0/1/2/3 rise and fall to an accuracy of up to 1/128 times the period of the GPT core clock (GTCLK). The GPT core clock (GTCLK) can be selected from PCLKD or GPTCLK.

The GTDLYCR register controls the PWM delay generation circuit, which applies delays to the PWM outputs. GTDLYCR register can be written when register write protection is disabled (GPT320.GTWP.WP = 0).

When changing GTDLYCR after changing the value of GPT320.GTWP.WP bit, be sure to read back the value of GTWP register before changing the value of GTDLYCR.

DLLEN bit (DLL Operation Enable)

The DLLEN bit selects whether the on-chip DLL in the PWM delay generation circuit is activated or not.

DLYRST bit (PWM Delay Generation Circuit Reset)

The DLYRST bit resets the internal state of the PWM delay generation circuit.

FRANGE[1:0] bit (GPT core clock Frequency Range)

The FRANGE[1:0] bits set the frequency range of the GPT core clock.

Set the FRANGE[1:0] bits only when the DLLEN bit is 0.

24.2.2 GTDLYCR2 : PWM Output Delay Control Register 2

The GTDLYCR2 register controls each channel of PWM delay generation circuit. GTDLYCR2 can be written when register write protection is disabled (GPT320.GTWP.WP = 0).

When changing GTDLYCR2 after changing the value of GPT320.GTWP.WP bit, be sure to read back the value of GTWP register before changing the value of GTDLYCR2.

DLYBSn (n = 0 to 3) bit (PWM Delay Generation Circuit Bypass for channel n)

The DLYBSn bit selects whether delays are applied to PWM output signals from the GTIOCnA and GTIOCnB pins (n = 0 to 3) by the PWM delay generation circuit or whether the circuit is bypassed.

A signal delayed in the PWM delay generation circuit is output 3 cycles of GPT core clock (GTCLK) later than if it bypasses the PWM delay generation circuit.

DLYENn (n = 0 to 3) bit (PWM Delay Generation Circuit Enable for channel n)

The DLYENn bit selects whether channel n (n = 0 to 3) of PWM delay generation circuit is power on or off. If channel n of the PWM delay generation circuit is not used, set to 1.

24.2.3 GTDLYRnA : GTIOCnA Rising Output Delay Register (n = 0 to 3)

The GTDLYFnB register sets a delay to be applied to falling edges of output signals on the GTIOcNB pin. On the timing for the transfer of settings, see [section 24.3.2. Timing for Transfer of GTDLYRnA, GTDLYRnB, GTDLYFnA, and GTDLYFnB Register Settings](#).

GTDLYFnB can be written when register write protection is disabled (GPT32n.GTWP.WP = 0).

When changing GTDLYFnB after changing the value of GPT32n.GTWP.WP bit, be sure to read back the value of GTWP register before changing the value of GTDLYFnB.

24.3 Operation

24.3.1 Adjustments to the Timing of Rising and Falling Edges in PWM Waveforms

The timing of rising and falling edges in PWM waveforms which are output from the GTIOcNA and GTIOcNB pins, where n = channel number, can be delayed to an accuracy of 1/64 or 1/128 of the GPT core clock (GTCLK) period.

If the timing of rising or falling edges in PWM waveforms output from the GTIOcNA and GTIOcNB pins must be adjusted, initialize the PWM generation circuit as shown in the procedure in [Figure 24.2](#).

**Figure 24.2** Example of initialization flow for the PWM delay generation circuit

In the PWM delay generation circuit, delay can be applied to rising and falling edges of the PWM output to an accuracy of 1/64 or 1/128 of the period of the GPT core clock (GTCLK). This is described in [section 23.3.3. PWM Output Operating Mode](#). Delays associated with the settings are reflected in the PWM output with the timing described in [section 24.3.2. Timing for Transfer of GTDLYRnA, GTDLYRnB, GTDLYFnA, and GTDLYFnB Register Settings](#). [Table 24.3](#) shows the association between the GTDLYRnA, GTDLYRnB, GTDLYFnA, and GTDLYFnB registers and the PWM outputs.

Table 24.3 Association between PWM output pins and delay setting registers

PWM output pin	Rising-edge delay setting register	Falling-edge delay setting register
GTIOC0A	GTDLYR0A	GTDLYF0A
GTIOC0B	GTDLYR0B	GTDLYF0B
GTIOC1A	GTDLYR1A	GTDLYF1A
GTIOC1B	GTDLYR1B	GTDLYF1B
GTIOC2A	GTDLYR2A	GTDLYF2A
GTIOC2B	GTDLYR2B	GTDLYF2B
GTIOC3A	GTDLYR3A	GTDLYF3A
GTIOC3B	GTDLYR3B	GTDLYF3B

When the PWM delay generation circuit is in use, the timing with which a PWM output signal rises and falls can be controlled to an accuracy of 1/64 or 1/128 of the period of the GPT core clock (GTCLK). When this option is not in use, the period of the PWM output waveform is controlled to an accuracy of one period of the input clock for the timer counter, which is GTCLK. With the PWM delay generation circuit, the output can be controlled to an accuracy 32 times better.

Additionally, the delay settings also control the periods at high and low level for the PWM waveform to the given accuracy. PWM delay generation circuit channels can be individually enabled or disabled.

24.3.2 Timing for Transfer of GTDLYRnA, GTDLYRnB, GTDLYFnA, and GTDLYFnB Register Settings

Settings for the GTDLYRnA, GTDLYRnB, GTDLYFnA, and GTDLYFnB registers are initially transferred to temporary registers, and then reflected in the delay on the GTIOCnA and GTIOCnB ($n = 0$ to 3) outputs. Transfer of the settings takes place on overflows (in up-counting) or underflows (in down-counting) for saw waves, and in the troughs of triangle waves.

Figure 24.3 and Figure 24.4 show examples of the operation of the GTDLYR0A and GTDLYF0A registers.

Figure 24.3 Example of GTDLYR0A register operation with PWM saw-wave generation

Figure 24.4 Example of GTDLYF0A register operation with PWM triangle-wave generation

24.4 Usage Notes

24.4.1 Settings for the Module-Stop Function

The Module Stop Control Register D (MSTPCRD) can enable or disable operation of the PWM delay generation circuit. The PWM delay generation circuit is initially stopped after reset. Releasing the module-stop state enables access to the registers. For details, see [section 11, Low Power Mode](#).

24.4.2 Notes on Delay Settings for PWM Delay Generation Circuit

When the PWM delay generation circuit generates delays for a PWM output waveform and the waveform is toggled in response to compare-matches, do not change the settings for delay while the compare-match value is within the ranges listed in [Table 24.4](#). This constraint applies to the GTDLYFnA, GTDLYRnA, GTDLYFnB, and GTDLYRnB registers.

Table 24.4 Constraints on delay settings

Mode	Direction of counting	Compare-match value
Saw-wave mode	Up	GTPR - 2 or above
	Down	2 or below
Triangle-wave mode	Down	2 or below

[Figure 24.5](#) shows an example of how the constraints apply to the timing of setting GTDLYFnA in saw-wave waveform one-shot pulse mode (counting up). Do not change the value set in GTDLYFnA while $GTCCRD \geq GTPR - 2$.

Figure 24.5 Constraints on the timing of GTDLYF0A register settings

Changing the values in the GTDLYFnA, GTDLYRnA, GTDLYFnB, and GTDLYRnB registers during periods where changes to settings are not allowed, might lead to faulty output waveforms such as shifts in the timing of output waveform transitions from the expected values.

24.4.3 Register Write Interval

When GPT core clock is GPTCLK, the writing value may not be reflected if the interval between writing to the GTDLYRnA/GTDLYFnA/GTDLYRnB/GTDLYFnB register is shorter than the following interval time. This restriction only applies to successive writes to the same register.

$$\text{Write_Interval [ns]} = \text{Period_of_PCLKA [ns]} \times 6 + \text{Period_of_GPTCLK [ns]} \times 4$$
